

# Persuasive Technologies: 02—Introduction to Kivy

Klen Čopič Pucihar

# Why kivy?

# UI Widgets

Kivy 1.4.0-dev - Showcase

Widgets

- Standard widgets
- Complex widgets
- Scatters
- Treeviews
- Popup

Layouts

- Anchor Layout
- Box Layout
- Float Layout
- Grid Layout
- Stack Layout

# Multitouch interface

<https://vimeo.com/22725621>

# What is Kivy

- Open source Python library for rapid development of applications that make use of innovative user interfaces, such as multi-touch apps.
- Not only for desktop also for mobile
- You need kivy interpreter for Android Kivy Launcher
- Can build stand alone apps (e.g. apk):
  - python-for-android project
  - Buildozer tool

# Create an application

1. sub-classing the App class
2. implementing its build() method so it returns a Widget instance (the root of your widget tree)
3. instantiating this class, and calling its run() method.

# Basic app: primer1/main.py

```
from kivy.app import App
from kivy.uix.button import Button #Button widget

def callback(instance): #Callback for button click
    print 'Hello Kivy'

class TestApp(App): #Sub-classing App

    def build(self):
        button = Button(text='Hello world',
font_size=14)
        button.bind(on_press=callback)
        return button #Button is root widget
TestApp().run()
```

# Constrictor & Layout

## 13\_primer\_2/main.py

```
from kivy.app import App
from kivy.uix.gridlayout import GridLayout
from kivy.uix.label import Label
from kivy.uix.textinput import TextInput

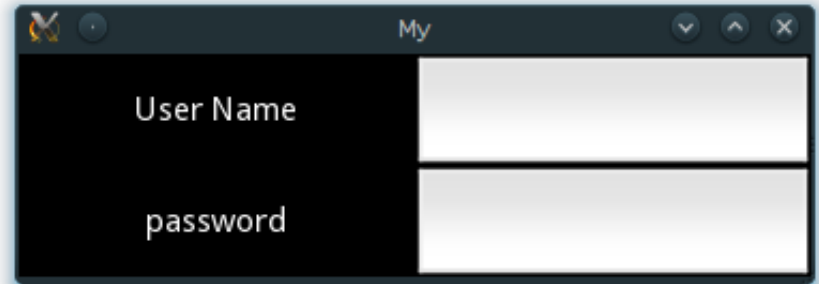

class LoginScreen(GridLayout):

    def __init__(self, *kwargs):
        super(LoginScreen, self).__init__(**kwargs)
        self.cols = 2
        self.add_widget(Label(text='User Name'))
        self.username = TextInput(multiline=False)
        self.add_widget(self.username)
        self.add_widget(Label(text='password'))
        self.password = TextInput(password=True, multiline=False)
        self.add_widget(self.password)

class MyApp(App):

    def build(self):
        return LoginScreen()

MyApp().run()
```

# Naloge I

Naloga 1: Posodobi skripto iz prejsnje naloge tako, da ji dodas gumb login in username zamenjas z email naslovom.

Naloga 2: Posodobi skript tako da ob kliku na gumb login prilazes vsebino obeh polj v popup sporočilu. Pop up sporočilo naj ima tudi gumb close popup.

Naloga 3: Preveri ali sta geslo in password pravilna. Pravilnost ugotavljas preko HTTP GET zahtevka. O uspešnosti poročaj uporabniku preko popup sporočila:

[http://www.studenti.famnit.upr.si/~famnit.student/naloge\\_teden\\_6/06\\_naloga\\_1/login\\_python.php?email=example@famnit.upr.si&passwd=pwd](http://www.studenti.famnit.upr.si/~famnit.student/naloge_teden_6/06_naloga_1/login_python.php?email=example@famnit.upr.si&passwd=pwd)

Veljavni logine najdes na:

[http://www.studenti.famnit.upr.si/~famnit.student/naloge\\_teden\\_6/06\\_naloga\\_1/](http://www.studenti.famnit.upr.si/~famnit.student/naloge_teden_6/06_naloga_1/)

Za klic na strežnik uporabis:

```
import urllib2
urllib2.urlopen("http://example.com/foo/bar").read()
```

# Touch: 13\_primer\_3/main.py

```
from kivy.app import App
from kivy.uix.widget import Widget

class MyPaintWidget(Widget):
    def on_touch_down(self, touch):
        print touch

class MyPaintApp(App):
    def build(self):
        return MyPaintWidget()

MyPaintApp().run()
```

# Drawing: 13\_primer\_4/main.py

```
...import...
```

```
points=[];
```

```
class MyPaintWidget(Widget):
```

```
    def on_touch_down(self, touch):
```

```
        with self.canvas:
```

```
            Color(1, 1, 0)
```

```
            d = 30.
```

```
            Ellipse(pos=(touch.x - d / 2, touch.y - d / 2), size=(d, d))
```

```
            global points
```

```
            points.append(touch.x);
```

```
            points.append(touch.y);
```

```
            Line(points=points);
```

```
class MyPaintApp(App):
```

```
    def build(self):
```

```
        return MyPaintWidget()
```

```
MyPaintApp().run()
```

# Naloge II

Naloga 1: Dodaj gumb za brisanje zaslovna.

Namig:

```
painter = MyPaintWidget()  
painter.canvas.clear()
```

Naloga 2: Risi crto tudi on “mouse move action”.

Namig:

```
def on_touch_move(self, touch):  
    ??
```

Naloga 3: Ob vsakem kliku generiraj risis z drugo barvo. Barvo generiraj s pomocjo random funkcije.

Namig:

```
from random import random  
rand_num = random()
```
