

# Programming

## Numbers, strings and arrays

# Overview

- Numbers' presentation:
  - Basic data types
  - Classes
- Stringd
- Arrays

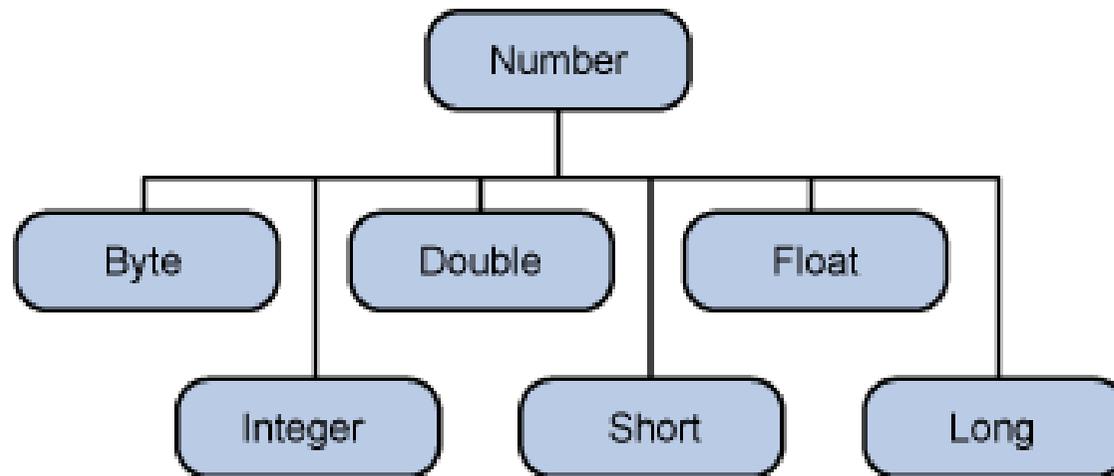

# Basic data types

- We already covered the subject:
  - int, byte, short, long
  - double, float
  - char
  - ~~□ boolean~~

# Class `java.lang.Number`

- Extended from **Number**:

- Byte
- Short
- Integer
- Long
- Float
- Double

- Classes instead of basic data types → **ovijanje** (*wrapping*)

# Why classes?

- 3 reasons for class usage instead of basic data types
  - When the parameter of a method is an object
  - The need for MIN\_VALUE in MAX\_VALUE
  - The usage of methods (**method**) for translation/transformation between basic data types

- Example:

```
Integer x, y;  
x = 12;  
y = 15;  
System.out.println(x+y);
```

# Methods of the “number” classes

- Methods of the Number class and subclasses:

<http://java.sun.com/j2se/1.5.0/docs/api/java/lang/Number.html>

- Why are they useful?
  - ... homework ...

# Characters – char and Character

## ■ Examples:

```
char ch = 'a';
char uniChar = '\u0391';
    // Unicode representation of the Greek omega
char[] charArray = { 'a', 'b', 'c', 'd', 'e' };
    // array of characters
Character ch = new Character('a');
Character ch = 'a';
    // basic type 'a' is wrapped into and object of the
    // type Character
Character test(Character c) {...}
    // object of the type Character is parameter of the
    // method and the type of the result of the method
char c = test('x');
    // wrapped and unwrapped
```

# Methods of the class `Character`

- `boolean isLetter(char ch)`
  - `boolean isDigit(char ch)`
  - `boolean isWhiteSpace(char ch)`
  - `boolean isUpperCase(char ch)`
  - `boolean isLowerCase(char ch)`
  - `char toUpperCase(char ch)`
  - `char toLowerCase(char ch)`
  - `toString(char ch)`
- 
- What are special characters? (`\t`, `\b`, `\n`, `\r`, `\f`, `\'`, `\"`, `\\`)

# Strings - definition

- Examples of the definitions of strings (*String*):

```
String greeting = "Hello world!";
```

```
char[] helloArray = { 'h', 'e', 'l', 'l', 'o', '.'};
```

```
String helloString = new String(helloArray);
```

```
System.out.println(helloString);
```

# Strings – length, concatenation

- How do we establish the length of a string?

```
String palindrome = "Dot saw I was Tod";  
int len = palindrome.length();
```

- How to concatenate strings?

```
string1.concat(string2);  
"My name is ".concat("Rumplestiltskin");  
"Hello," + " world" + "!"
```

# Strings ++

- What can we do with strings?
  - Convert them into numbers and vice-versa
  - Process characters in strings:
    - Find characters, substrings
    - Change case
    - Change characters, substrings, ...

<http://java.sun.com/docs/books/tutorial/java/data/manipstrings.html>

<http://java.sun.com/j2se/1.5.0/docs/api/java/lang/String.html>

# Arrays

- Declaration, initialization and access:

```
class ArrayDemo {  
    public static void main(String[] args) {  
        int[] anArray; // declaration of an array of integer numbers  
        anArray = new int[10]; // memory allocation for 10 integers  
        anArray[0] = 100; // initialization of the 1. element  
        anArray[1] = 200; // initialization of the 2. element  
        anArray[2] = 300; // ...  
  
        ...  
    }  
}
```

- ...all in one:

```
int[] anArray = {100, 200, 300, 400, 500, 600};
```

# More about arrays ... (1)

- In the memory:

The statement `list = new int[5];` creates an array that can hold five ints, and sets `list` to refer to it.

(5)
0
0
0
0
0

The array object contains five integers, which are referred to as `list[0]`, `list[1]`, and so on. It also contains `list.length`, which gives the number of items in the array. `list.length` can't be changed.

# More about arrays ... (2)

- Arrays for search and sorting

Start with a partially sorted list of items:

4	11	13	17	35	15	7	45	12	19	3	22
---	----	----	----	----	----	---	----	----	----	---	----

15

4	11	13	17	35		7	45	12	19	3	22
---	----	----	----	----	--	---	----	----	----	---	----

15

4	11	13	15	17	35	7	45	12	19	3	22
---	----	----	----	----	----	---	----	----	----	---	----

4	11	13	15	17	35	7	45	12	19	3	22
---	----	----	----	----	----	---	----	----	----	---	----

Now, the sorted part of the list has increased in size by one item.

# More about arrays ... (3)

## Multi-dimensional arrays

If you create an array `A = new int[3][4]`, you should think of it as a "matrix" with 3 rows and 4 columns.

1	0	12	-1
7	-3	2	5
-5	-2	2	-9

But in reality, `A` holds a reference to an array of 3 items, where each item is a reference to an array of 4 ints.

```
int[][] A = { { 1, 0, 12, -1 },
              { 7, -3, 2, 5 },
              { -5, -2, 2, -9 }
            };
```

```
int[][] A = new int[3][4];
for (int row = 0; row < 3; row++) {
    for (int column = 0; column < 4; column++) {
        A[row][column] = 0;
    }
}
```

# More about arrays ... (4)

- Dynamic arrays:
  - Variable-length arrays

- "Half-empty" arrays

- Special objects

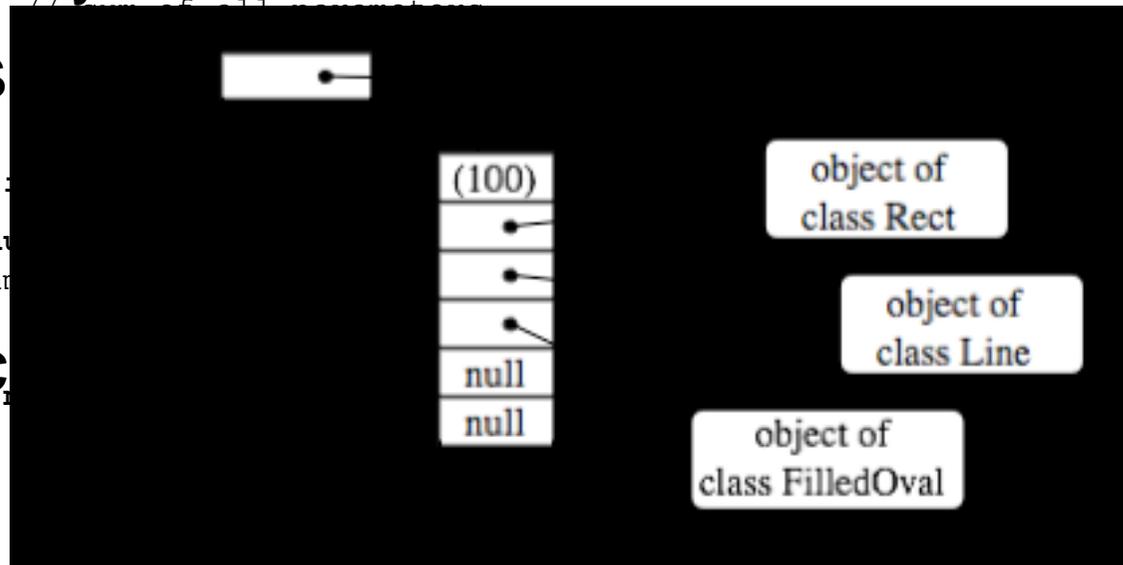

- ArrayList

- Vector

- Let us write a class

```

public static double average( double[] numbers ) {
    double sum;
    double average;
    sum = 0;
    for ( int i = 0; i < numbers.length; i++ )
        sum = sum + numbers[i];
    average = sum / numbers.length;
    return average;
}
    
```

# Summary

- What have we smo izvedeli?
  - About “number classes”, wrapping of basic data types, ...
  - About characters and strings
  - About arrays and possible usages
